

Warehouse Inventory Tracker

You are helping a small warehouse manage its products and customer orders. The warehouse has the following product information:

Product ID	Product	Category	Price	Quantity
P101	Keyboard	Electronics	1200	15
P102	Mouse	Electronics	700	25
P103	Notebook	Stationery	80	50
P104	Pen	Stationery	20	100
P105	Water Bottle	Utility	450	20

Question 1 — Store the product information

Create a variable that stores all five product records. Each product record should contain:

- Product ID
- Product name
- Category
- Price
- Quantity

Print the complete product information.

Question 2 — Access individual information

Using the data created in Question 1:

1. Print the name of the first product.
2. Print the price of the third product.
3. Print the quantity of the last product.

Question 3 — Display all products

Display every product using a loop. The output should look approximately like:

```
P101 - Keyboard - ₹1200 - 15 units
P102 - Mouse - ₹700 - 25 units
```

Question 4 — Check stock

The warehouse considers a product to need restocking when fewer than 20 units are available. Go through all products and display products which require restocking

Question 5 — Calculate inventory value

For every product, calculate its inventory value:

```
price × quantity
```

Display the inventory value for each product. Then calculate and display the total value of all products currently in the warehouse.

Question 6 — Product lookup

Ask the user to enter a Product ID. Display the corresponding product name.

If the Product ID does not exist, display:

```
Product not found
```

Test your program with both an existing and a non-existing Product ID.

Question 9 — Check stock for processing a customer order

A customer provides:

- Product ID
- Quantity required

Check:

- Display Product not found if the Product ID does not exist.
- Display Insufficient stock if the requested quantity is greater than the available quantity.
- Otherwise display Order accepted.
